SUMMARY:

QUESTION 1: ✅ (pass for my I.M.O acceptance criteria/s)

- Record count matches (same as the test doc, same as the excel filtering)
- No dropped/truncated data/records
- All values match
- No errors on main and sub queries

QUESTION 2: ✅

- query matches the results from the test suites/docs
- Result from the docs, matches the llm output from the tests, also matches the excel data

QUESTION 3: ✅

- Result from the docs, matches the llm output from the tests, and the excel data

QUESTION 4: ❌ (so - so)

- Bit of an accuracy error. Ran the query at least 6x times and all of them didnt match the results from the docs
- Inconsistencies come from the LLM translation from “human words” to query creation.
- No errors. All related columns used are correct.

QUESTION 5: ✅

- Record count matches
- Only new “behavior” ive found is that when I brute force to use a mysql query as my input, the LLM corrects it on what actually exists on the data set/columns.
    - The also goes through the “thinking” steps of how it got to the results and the corrections

QUESTION 6: ✅

- No errors on initial input
- The LLM says “100 results”. And as per usual only actually getting 20 ish in the terminal
- That said, all values, column names, match what is expected from the query

QUESTION 7: ✅

- Same error as the docs, (raw data set structure issue)
- Again fixed by adding template and specifying date format
- Post fix:
    - All records match (llm output to excel filter/query)
    - Handles consecutive prompts and edge cases (some)
    - Reproducible results

QUESTION 8: ✅

- Same error as mentioned in the docs
- Fixed it by adding a new template code
- Post fix:
    - Record count matches (same as the test doc, same as the excel filtering)
    - All values match

- General problem: I sometimes get an inconsistent number of output/query results from the llm. Eg. executing query # 5 initially outputted only 30 results. Running it again gives 40.
    - Not sure if its my setup limitation, or the api/ai

Q1 order, names + 1 month

- Only did the initial query, replicating the results
- Llm test results match the test doc and the excel data
- Multiple X of making the same input the llm was able to consistently use the same query; thus, same output/results everytime
- No comments here. All good.

- Imo the query is not that complex so its great that it can handle this simple question.

Q2 customers + dates

- Llm query:

```
SELECT `Customer_Name`, COUNT(*) as num_delayed_orders
FROM `raw_import_1`
WHERE (`OrderHed_OrderDate` LIKE '%/24' OR `OrderHed_OrderDate` LIKE '%/25')
  AND `zLateCount2` NOT IN ('$0', '$-')
GROUP BY `Customer_Name`
ORDER BY num_delayed_orders DESC
LIMIT 5
```

- Matches the results listed in the docs
- Matches the raw data values

	A	B
1	OrderHed_OrderDate	(Multiple Items)
2	zLateCount2	1
3		
4	**Row Labels**	**Count of Customer_Name**
5	TECWISE SISTEMAS DE AUTOMAÇÃO LTDA.	448
6	F & A Geoingenieria S.A.C.	257
7	TECWISE INNOVACION DIGITAL SPA	240
8	R.H. Snelle Logistieke S.A. DE C.V.	236
9	Dam Instruments Co., Ltd	184
10	**Grand Total**	**1365**
11		

- No comments here. All good.

- …other than my personal gripe of the llm outputting the result not “user” or normie friendly. Nobody cares about dictionaries until you know how to read code. That said, it will probably be improved on the twilio sms implementation

Q3 similar to Q6

- Query used by the LLM (prompt 1):
  ```
  SELECT `ShipDtl_PartNum`, COUNT(*) as num_delays
  FROM `raw_import_1`
  WHERE `OrderHed_OrderDate` LIKE "%/25" AND `zLateCount2` NOT IN ("$0", "$-")
  GROUP BY `ShipDtl_PartNum`
  ORDER BY num_delays DESC
  LIMIT 100
  ```

- Matches the results from the docs.
- This is another simple query same as Q1. nothing else to add here.

Q4 zLate columns

- Query used by the LLM:
  ```
  SELECT ShipDtl_PartNum, COUNT(*) as num_delays
  FROM raw_import_1
  WHERE OrderHed_OrderDate LIKE '%/25' OR OrderHed_OrderDate LIKE '%/26'
    AND zLateCount2 NOT IN ('$0', '$-')
  GROUP BY ShipDtl_PartNum
  ORDER BY num_delays DESC
  LIMIT 100
  ```

- Query used by the LLM (prompt 2):
  ```
  SELECT ShipDtl_PartNum, COUNT(*) as num_delays
  FROM raw_import_1
  WHERE (OrderHed_OrderDate LIKE '%/25' OR OrderHed_OrderDate LIKE '%/26')
    AND zLateCount2 NOT IN ('$0', '$-')
  GROUP BY ShipDtl_PartNum
  ORDER BY num_delays DESC
  LIMIT 100
  ```
  - Note the difference in the WHERE field

- Outputs change every prompt, need actual check with the raw data set.
- Output from the llm:
  🎯 100 RESULTS:

  ```
  [
    {
      "ShipDtl_PartNum": "EL380004-INST",
      "num_delays": 76
    },
    {
      "ShipDtl_PartNum": "DATA LOGGER-SE",
      "num_delays": 51
    },
    {
      "ShipDtl_PartNum": "ICC2TC",
      "num_delays": 33
    },
    {
      "ShipDtl_PartNum": "ELSPLICE4",
      "num_delays": 30
    },
    {
      "ShipDtl_PartNum": "ICSC2BC",
      "num_delays": 22
  ```

},
{
"ShipDtl_PartNum": "EL380004-BULK",
"num_delays": 22
},
{
"ShipDtl_PartNum": "EL380004HDL-INST",
"num_delays": 19
},
{
"ShipDtl_PartNum": "VW2106",
"num_delays": 18
},
{
"ShipDtl_PartNum": "ICSC210",
"num_delays": 17
},
{
"ShipDtl_PartNum": "VW2100-0.7-EL380004",
"num_delays": 14
},
{
"ShipDtl_PartNum": "ICGC210",
"num_delays": 13
},
{
"ShipDtl_PartNum": "VW2100-0.35-L30",
"num_delays": 13
},
{
"ShipDtl_PartNum": "IC35600",
"num_delays": 13
},
{
"ShipDtl_PartNum": "VW2100-1.0-EL380004",
"num_delays": 12
},
{
"ShipDtl_PartNum": "DT2011B-USB-D_CELL",
"num_delays": 12
},
{
"ShipDtl_PartNum": "VW2100-0.7-L50",
"num_delays": 11

```
  },
  {
    "ShipDtl_PartNum": "ICGC2BC",
    "num_delays": 11
  },
  {
    "ShipDtl_PartNum": "IC8051",
    "num_delays": 10
  },
  {
    "ShipDtl_PartNum": "VW2100-0.35-EL380004",
    "num_delays": 10
  },
  {
    "ShipDtl_PartNum": "DT2055B-USB-D_CELL",
    "num_delays": 10
  }
]
```

- Filter from the actual data set:

	A	B
1	OrderHed_OrderDate	(Multiple Items)
2	zLateCount2	1
3		
4	**Row Labels**	**Count of ShipDtl_PartNum**
5	EL380004-INST	76
6	DATA LOGGER-SE	51
7	ICC2TC	33
8	ELSPLICE4	30
9	ICSC2BC	22
10	EL380004-BULK	22
11	EL380004HDL-INST	19
12	VW2106	18
13	ICSC210	17
14	VW2100-0.7-EL380004	14
15	ICGC210	13
16	IC35600	13
17	VW2100-0.35-L30	13
18	DT2011B-USB-D_CELL	12
19	VW2100-1.0-EL380004	12
20	VW2100-0.7-L50	11
21	ICGC2BC	11
22	DT2055B-USB-D_CELL	10
23	VW2100-0.35-EL380004	10
24	VW2106-AG	10
25	IC8051	10
26	VW2100-2.0-L200	9
27	VW2100-0.7-L30	9
28	VW2100-2.0-EL380004	9
29	IC8000	9
30	AFFINITY LOGGER-10-10-00-00-00-3-11-2	9
31	VW2100-3.0-EL380004	8
32	DT2011B-RSTAR-NO_BATT-BRZ	8
33	IC32205	8
34	VW2100-5.0-HD-EL380004	7
35	VW2100-1.0-L75	7
36	VW2100-0.35-L50	7

- Matches the data values. So the error must be from the LLM translation from the human words to mysql query creation

Q5 frequence + count

- Query input from the LLM
  SELECT `Customer_Name`, COUNT(*) as total_ordered
  FROM `raw_import_1`
  WHERE `OrderHed_OrderDate` LIKE "%/24" OR `OrderHed_OrderDate` LIKE "%/25"
  GROUP BY `Customer_Name`
  ORDER BY total_ordered DESC
  LIMIT 100

- Output:
  🎯 100 RESULTS:

```
[
  {
    "Customer_Name": "TECWISE SISTEMAS DE AUTOMAÇÃO LTDA.",
    "total_ordered": 641
  },
  {
    "Customer_Name": "Suncor Energy Oil Sands Limited",
    "total_ordered": 591
  },
  {
    "Customer_Name": "TECWISE INNOVACION DIGITAL SPA",
    "total_ordered": 386
  },
  {
    "Customer_Name": "F & A Geoingenieria S.A.C.",
    "total_ordered": 375
  },
  {
    "Customer_Name": "R.H. Snelle Logistieke S.A. DE C.V.",
    "total_ordered": 363
  },
  {
    "Customer_Name": "EVR Operations Ltd.",
    "total_ordered": 346
  },
  {
    "Customer_Name": "Dam Instruments Co., Ltd",

- **This perfectly matches the results from the LLM**
- This result, however, does not match the results from the test suite (from nick)
    - Am assuming its the difference in the date range. But in any case the AI/LLM is able to translate “human words” and group the customer names from the raw data calculate calculate orders that ONLY matches the name
    - **NO HALLUCINATIONS**
    - **NO INCONSISTENCIES when actual parameters are really specified well.**
- The llm corrects my error in the query:

```
gpgp> SELECT `Customer_Name`, SUM(`Customer_Name`) as total_ordered FROM `raw_import_1` WHERE `OrderHed_OrderDate` LIKE "%/24" OR
`OrderHed_OrderDate` LIKE "%/25" GROUP BY `Customer_Name` ORDER BY total_ordered DESC LIMIT 100;
💭 Thinking...
🔍
SELECT `Customer_Name`, COUNT(*) as total_ordered
FROM `raw_import_1`
WHERE `OrderHed_OrderDate` LIKE "%/24" OR `OrderHed_OrderDate` LIKE "%/25"
GROUP BY `Customer_Name`
ORDER BY total_ordered DESC
LIMIT 100
✓ 100 results

AI> The query you provided has an error. The `SUM` function cannot be applied to the `Customer_Name` column, as it is a text colum
n. Here is the corrected query:

🎯 100 RESULTS:

[
  {
    "Customer_Name": "TECWISE SISTEMAS DE AUTOMAÇÃO LTDA.",
    "total_ordered": 641
```

Q6 customer + ordered

- Query run: **no error,**
- Output: 100 results (but outputs only 20 on the prompt
- Query used by the AI:

```
SELECT `Customer_Name`, COUNT(*) as cnt
FROM `raw_import_1`
WHERE `OrderHed_OrderDate` LIKE "%/25" OR `OrderHed_OrderDate` LIKE "%/26"
GROUP BY `Customer_Name`
HAVING cnt <= 5
ORDER BY cnt ASC
LIMIT 100
```

- 20 out of 20 names in the LLM output match the query filter done in the Excel data
- All counts are 1
-

Q7 products calc

- Again raw data structure problem (this and Q8 would probably be circumvented if we could just re-design or normalize the whole table… but its 30k line of data, not really feasible. Anyways…
- Encountered the same calculation error with nulls
- Fix: just ignore SQL comments and force feed it to anthropic to do proper sql injection/query
- Output after the fix:

```
gpgp> which products have the shortest order to ship dates and which ones have the longest (top 5)?
💭 Thinking...
🔍 (SELECT `ShipDtl_PartNum`,
       DATEDIFF(STR_TO_DATE(`ShipHead_ShipDate`, "%c
✓ 10 results

AI>

🎯 10 RESULTS:

[
  {
    "ShipDtl_PartNum": "ICGC210",
    "lead_time": -3,
    "Type": "Shortest"
  },
  {
    "ShipDtl_PartNum": "ICC2TC",
    "lead_time": -3,
    "Type": "Shortest"
  },
  {
    "ShipDtl_PartNum": "DT20XX-M1",
    "lead_time": 0,
    "Type": "Shortest"
  },
  {
    "ShipDtl_PartNum": "ICA0121-3",
    "lead_time": 0,
    "Type": "Shortest"
  },
  {
    "ShipDtl_PartNum": "CR300",
    "lead_time": 0,
```

- Showed 10 results (top 5 longest and top 5 shortest)
- I then supplemented it by making a query (similar to Q8 from this initial query:

```
gpgp> for these product results, what are the everage order lines per order on the month of December?
💭 Thinking...
🔍 SELECT
  SUBSTRING_INDEX(`OrderHed_OrderDate`, "/", 1) AS Month,
  SUBSTRING_IN
✓ 1 results

AI>

🎯 1 RESULTS:

[
  {
    "Month": "12",
    "Year": "25",
    "AvgLines": "5.1682"
  }
]
```

- No error ~~and actually calculated from the previous prompt, which is good. (relational, and previous prompt persist)~~
    - Checked the query and didnt use the prompt at all:

```
SELECT
  SUBSTRING_INDEX(`OrderHed_OrderDate`, "/", 1) AS Month,
  SUBSTRING_INDEX(`OrderHed_OrderDate`, "/", -1) AS Year,
  AVG(CAST(`OrderDtl_OrderLine` AS DECIMAL)) AS AvgLines
FROM `raw_import_1`
WHERE `OrderHed_OrderDate` LIKE "12/%/25"
GROUP BY Year, Month
LIMIT 1
```

- For this, had to do a bit of gpcheating, and added another bandaid fix template

```
gpgp> for these product results, what are the everage order lines per order on the month of December?
💭 Thinking...
🔍
SELECT
  SUBSTRING_INDEX(`OrderHed_OrderDate`, "/", 1) AS Month,
  SUBSTRING_INDEX(`OrderHed_OrderDate`, "/", -1) AS Year,
  AVG(CAST(`OrderDtl_SellingQuantity` AS DECIMAL)) AS AvgLines
FROM `raw_import_1`
WHERE
  `ShipDtl_PartNum` IN (
    'ICGC210', 'ICC2TC', 'DT20XX-M1', 'ICA0121-3', 'CR300',
    'ELGL1206-SO232235-14', 'LOGGERNET', 'SSSP105RV-3',
    'SSVW105-70KPA-EL380004', 'SSSP106M'
  )
  AND `OrderHed_OrderDate` LIKE '12/%/25'
GROUP BY Month, Year
LIMIT 1
✔ 1 results

AI> To get the average order lines per order in the month of December for the products in the previous query, I would run the following SQL:

🎯 1 RESULTS:

[
  {
    "Month": "12",
    "Year": "25",
    "AvgLines": "13.7143"
  }
]

gpgp> S
```

- Now the manager has a bit of a short term memory for consecutive queries
- Manual validation from COTD xlsx:

	A	B	C	D	E	F	G	H	I	J	K	L	M	N
1	ICGC210	20		20										
2	ICC2TC	115		1	6	3	15	4	3	50	10	10	4	9
3	DT20XX-M1	0		0										
4	ICA0121-3	0		0										
5	CR300	0		0										
6	ELGL1206-SO232235-14	1		1										
7	LOGGERNET	1		1										
8	SSSP105RV-3	0		0										
9	SSVW105-70KPA-EL380004	0		0										
10	SSSP106M	0		0										
11		13.7000												
12														

- The query result matches the raw data file average. perfect.

Q8 lines calc + month filter

- Did a very specific code template band aid fix for the grouping order error
- Output after the fix:

```
gpgp> Show a chart with average number of order lines per order by months in 2025 and 2026.
💭 Thinking...
🔍 SELECT
  SUBSTRING_INDEX(`OrderHed_OrderDate`, "/", 1) as Month,
  SUBSTRING_IN
✓ 13 results

AI> Here is the SQL query to get the average number of order lines per order by month in 2025 and 2026:

🎯 13 RESULTS:

[
  {
    "Month": "1",
    "Year": "25",
    "AvgLines": "4.5165"
  },
  {

```

- Needs manual validation from the actual data set
- Nit picks
    - Month “order” is bad, 1 > 10 > 11 …. .8 > 9 > 1 (duplicate with a different order count)
    - Need a general/non-specific query for specific condition fix
